

Keeping your feet healthy

Foot hygiene

- Wash your feet daily with soap and water, making sure to dry them thoroughly, especially between toes.
- Change your socks daily.
- Change your shoes at least every other day, if possible.
- Powder shoes daily with an antifungal foot powder

Tips for adults and older patients

- If your feet are excessively dry, use a moisturizer to keep them moist.
- If your feet perspire excessively, use an antifungal powder to keep them dry.

Tips for patients with chronic diseases

- Inspect your feet daily for cuts, scrapes, abrasions, and blisters. These could be related to a chronic condition you may have, such as diabetes, peripheral vascular disease, or arthritis. Placing a mirror on the floor can make looking for these signs easier.
- Do not cut thickened toenails or thickened skin, such as corns and calluses. See your doctor or foot care specialist.
- Do not soak your feet in hot water.
- Call a primary care physician, podiatrist, or foot care specialist at the first sign of a problem, such as a cut that won't heal or any other problem that causes concern.

How to select footwear that fits

- Check the front of the shoe for at least a half inch of space between the longest toe (often the second toe) and the tip of the shoe. Do this at least monthly in young children.
- Find shoes that have a **toe box** (the front of the shoe) wide enough and high enough to accommodate all the toes comfortably; a firm **counter** (the part that grips the heel) that extends to the arch; an **arch support** strong enough to balance the foot during walking; a **sole** supportive and shock absorbent enough for hard, flat surfaces; and **uppers** made of breathable materials.
- Shoes should be large enough to fit with any orthotic device you may use.
- Shoes should fit the activity you use them for and should protect the feet from pressure and friction. Walking shoes or other athletic-style shoes often work well for general use.

Shoe shopping tips

- The feet and ankles swell during the day. Shop for shoes later in the day.
- Have your feet measured each time you buy shoes. Also be aware that a size 10-D, for example, from one manufacturer may be a size 9 1/2-C from another, so always try on shoes before buying them.
- New shoes should fit comfortably in the store (snug but not tight). Don't buy shoes thinking they will stretch to fit.

Optional footwear

- If conventional shoes don't fit properly, consider extra-depth or custom-molded shoes. Diabetic patients can obtain shoes and multi-density inserts through the Medicare Diabetic Shoe Program (ask your doctor or foot care specialist)

Proper use of slippers

- Slippers do not have enough padding and support. Wear them only for the short walk from the bed to the bathroom.
