Q: Are strict vegetarians at risk of vitamin B₁₂ deficiency?

MARGARET A. NOVY, MPH, RD, LD

Department of Nutrition Therapy, Cleveland Clinic

A: THE ADEQUACY of a vegetarian's diet should be assessed on an individual basis, because people who call themselves vegetarians differ widely in the types of foods they eat.

Lacto-ovo vegetarians follow a less-restrictive diet that includes dairy products and eggs along with grains, vegetables, fruits, legumes, seeds, and nuts, while excluding meat, fish, and fowl.

Vegans (or "strict" vegetarians), in contrast, eat no animal products whatsoever: no dairy products, no eggs, no meat.

Between these two groups are many subgroups, often following diets based on philosophy or religion.

WHO IS AT RISK?

Vegans are at greater risk of vitamin B₁₂ deficiency than are lacto-ovo vegetarians. Even so, people who consume animal products can build up considerable stores of vitamin B₁₂, so that someone who has recently become a vegan may have enough to last as much as 20 to 30 years.¹ On the other hand, long-term vegans should be especially careful to get enough vitamin B₁₂, as should infants, children, and pregnant and lactating women. Several reported cases of vitamin B₁₂ deficiency causing neurologic disturbances occurred in infants whose nursing mothers were vegans.^{2,3} (Deficiency of vitamin B₁₂, which is required for cell division and blood formation, may result in anemia, fatigue, and nerve damage.)

HOW MUCH VITAMIN B₁₂ IS NEEDED AND WHERE IS IT FOUND?

The Recommended Dietary Allowance (RDA) for vitamin B₁₂ is 2.0 µg/day for adults,

TABLE 1

Vitamin B₁₂ content of some foods

FOOD	VITAMIN B ₁₂ (µg)
Salmon, cooked (3 ounces)	2.6
Low fat yogurt (1 cup)	2.2
Shrimp, cooked (3 ounces)	1.3
Ready-to-eat breakfast cereals, (3/4 cup)	1.5–6.0
Vegetarian burger patties (1 burger or 1 serving)	2.0–7.0
Fortified soy milks (1 cup)	3.0
Nutritional yeast (Red Star Vegetarian Support Formula), 1 Tbsp	4.0

2.2 µg/day during pregnancy, and 2.6 µg/day during breast-feeding.

Vitamin B₁₂ is predominantly found in animal products: meat, fish, poultry, eggs, milk, and other dairy foods. Plant foods do not contain vitamin B₁₂, except from soil contamination with microorganisms, an unreliable source.

Vegans can easily meet their need for vitamin B₁₂ by eating fortified foods or taking vitamin supplements.

Fortified food products include breakfast cereals, soy milk products, and vegetarian burger patties. Patients should be instructed to read the food label carefully, because fortification amounts may vary. Nutritional yeast can also serve as a source of vitamin B₁₂ if it is grown on a medium that is enriched with vitamin B₁₂.

Although foods such as seaweed, algae, spirulina, tempeh, and miso may claim to contain vitamin B₁₂ on the food label, it is in the inactive B₁₂ analogue rather than the active

Vegans should take B₁₂ supplements or eat fortified foods

The *Cleveland Clinic Journal of Medicine* uses the AMA's database of physician names and addresses. (All physicians are included in the AMA database, not just members of the AMA.) Only the AMA can update this data, and will accept a change-of-address notice only from you.

Be sure your primary specialty and type of practice also are up-to-date on AMA records. This information is important in determining who receives the *Cleveland Clinic Journal of Medicine*.

If you have ever notified the AMA that you did not want to receive mail, you will not receive the *Cleveland Clinic Journal of Medicine*. You can reverse that directive by notifying the AMA. Please note that a change of address with the AMA will redirect all medically related mailings to the new location.

vitamin. **TABLE 1** lists the B₁₂ content of some vegetarian foods.

Nearly all common multivitamins contain 100% of the RDA for vitamin B₁₂. Vitamin B₁₂ injections are not indicated unless the patient has pernicious anemia or has had part or all of his or her stomach removed, thereby reducing or eliminating the intrinsic factor needed for vitamin B₁₂ absorption.

■ ADVICE TO PATIENTS

Vegetarian diets, if appropriately planned, can be healthful and nutritionally adequate, and help prevent and treat certain diseases and conditions.⁴ Patients who avoid or limit animal products in their diets, however, should be encouraged to take supplements or eat fortified foods.⁵
