TABLE OF CONTENTS

FROM THE EDITOR ............................................................................ 273
The generalist, the specialist, and the patient with chronic kidney disease
Comanagement of patients who have a chronic disease is often a challenge.
B.F. MANDELL

COMMENTARY .................................................................................. 275
Niacin's effect on cardiovascular risk: Have we finally learned our lesson?
For now, the renaissance of niacin as a means of lowering cardiovascular risk is only wishful thinking.
S.J. NICHOLLS

THE CLINICAL PICTURE ...................................................................... 279
Syncope during a pharmacologic nuclear stress test
A dangerous interaction can arise if the culprit drug is overlooked because it is part of a combination product.
I. BUITRAGO, D. WOLINSKY, AND C.R. ASHER

THE CLINICAL PICTURE ...................................................................... 281
An 18-year-old woman with hepatic cysts
Echinococcus granulosus is a parasitic tapeworm; humans become infected when they ingest the eggs.
C.H. HO AND J. LIN

CONTINUED ON PAGE 272
Why study cardiovascular outcomes in type 2 diabetes?

New approaches and treatments for COPD

Victims of intimate partner violence: How to help

New-onset epilepsy in the elderly: Meeting the challenges

Prescribing and pregnancy: Beyond primum non nocere

Medical problems of kidney transplant recipients

Diagnostic urgency: Statin-induced myopathy

Sleep apnea ABCs: Airway, breathing, circulation

A 20-year-old woman with fatigue and palpitations
Her blood pressure is 92/48 mm Hg, and her electrocardiogram shows abnormalities. What is going on?

Managing advanced chronic kidney disease: A primary care guide
Primary care physicians can manage most aspects early on, but as it progresses, more care should shift to a nephrologist.

Heart failure in African Americans: Disparities can be overcome
African Americans are disproportionately affected by heart failure, but discrepant outcomes can be minimized.

Optimizing transitions of care to reduce rehospitalizations
Factors that contribute to poor care transitions, programs that improve them, and strategies for successful transitions.
